 AB Methods are described for performing **electrophoresis**  
 perpendicular to an Ampholine pH gradient, focused in a flat bed of  
 polyacrylamide gel. These procedures are useful in choosing optimum  
 conditions for disc **electrophoresis**, isotachophoresis, and  
 conventional **electrophoresis**, as well as for studying titrn.  
 curves of proteins and conditions for protein isoelec. focusing. The  
 advantages of crossed **electrophoresis**-isoelec. focusing in the  
 same gel are emphasized.
